Submit the following from the problem list: 2, 3, 5, 6, 8, 10, 11, 12, 13, 16, 23.

Submit two of the following: 19, 20, 21, 22, 24.

**Problem 1.** If p is a prime number, prove that the nonzero elements of  $\mathbb{Z}_p$  form a multiplicative group of order p-1. Show that this statement is false if p is not a prime.

*Proof.* Consider  $\mathbb{Z}_4 \setminus \{0\} = \{1,2,3\}$ .  $2(2) = 0 \notin \mathbb{Z}_4 \setminus \{0\}$ , so closure doesn't hold and it can't be a group under multiplication at all. Therefore, the statement is false if p is not prime. Now consider the statement for a prime p.

 $\mathbb{Z}_2 = \{0,1\}$  and so  $\mathbb{Z}_2^* = \{1\}$  is clearly a group under multiplication of order 2-1=1. Now consider any prime p > 2, which must be odd. p = 2k+1 for some  $k \in \mathbb{Z}^+$ . Observe.

 $\langle 2 \rangle_p^* = \{2,4,\ldots,2k\} \sqcup \{2(2k),\ldots\}$ . Well, since p = 2k+1, 2(2k) = 4k = 2k+2k = (2k+1)+(2k-1) = p+2k-1 = 2k-1 = p-2. So note that the elements following 2k must be odd since p is odd. Additionally, 2q(p-2) = -4q = p-4q for  $q = 1,\ldots,k-1$  and finally note that 2(k-1)(p-2) = 2(k-1)p-2(k-1)(2) = p-2k = 1. Therefore,

 $\langle 2 \rangle_p^* = \{2, 4, \dots, 2k\} \sqcup \{2(2k), \dots\} = \{2, 4, \dots, 2k\} \sqcup \{p-2, p-4, \dots, p-2k, \dots\} = \{2, 4, \dots, p-1\} \sqcup \{p-2, p-4, \dots, 1, 2, \dots\}$  and continuing in this fashion loops us back around to the evens.

So,  $\langle 2 \rangle_p^* = (\mathcal{E}_p \setminus \{0\}) \sqcup (\mathcal{O}_p) = \mathbb{Z}_p^*$  must therefore be a cyclic multiplicative group of order p-1.

## Problem 2.

- (a) Prove that the relation given by  $a \sim b \iff a b \in \mathbb{Z}$  is an equivalence relation on the additive group  $\mathbb{O}$ .
- (b) Prove that  $\mathbb{Q}/\mathbb{Z}$  is an infinite abelian group.

Proof.

(a) For any  $a, b, c \in (\mathbb{Q}, +)$ ,

$$[\mathbf{a} \sim \mathbf{a}]: \quad a - a = 0 \in \mathbb{Z} \implies a \sim a.$$

$$[\mathbf{a} \sim \mathbf{b} \implies \mathbf{b} \sim \mathbf{a}]: \quad a \sim b \implies a - b \in \mathbb{Z} \implies -(a - b) = b - a \in \mathbb{Z} \implies b \sim a.$$

$$[\mathbf{a} \sim \mathbf{b}, \mathbf{b} \sim \mathbf{c} \implies \mathbf{a} \sim \mathbf{c}]: \quad a \sim b, b \sim c \implies c \sim b \implies (a - b) - (c - b) = a - c \in \mathbb{Z} \implies a \sim c.$$

So  $\sim$  is an equivalence relation on  $(\mathbb{Q}, +)$ .

(b)  $\mathbb{Q}/\mathbb{Z} = \{ [\frac{a}{b}] = \frac{a}{b} + \mathbb{Z} \mid a, b \in \mathbb{Z} \text{ and } b \nmid a \}$ . Consider any  $q_1, q_2 \in (0, 1)$ . If  $[q_1] = [q_2]$ , then  $[q_1] - [q_2] = \mathbb{Z}$  and so  $q_1 - q_1 \in \mathbb{Z}$ . Well,  $q_1, q_2 \in (0, 1)$ , so  $q_1 - q_2 \in (-1, 1)$  and therefore  $q_1 - q_2 = 0$ . So  $[q_1] = [q_2] \Longrightarrow q_1 = q_2$ . On the other hand,  $q_1 = q_2 \Longrightarrow [q_1] = [q_2]$  by definition. So then

$$q_1 = q_2 \iff [q_1] = [q_2], \forall q_1, q_2 \in (0, 1).$$

Since the rationals are dense in  $\mathbb{R}$ , there are infinitely many distinct rationals in (0,1) and infinitely many distinct cosets of the form [q] where  $q \in (0,1)$ . Therefore,  $\mathbb{Q}/\mathbb{Z}$  is infinite. Lastly, since  $(\mathbb{Q},+)$  is Abelian, so is  $\mathbb{Q}/\mathbb{Z}$  since  $[q_1] + [q_2] = [q_1 + q_2] = [q_2 + q_1] = [q_2] + [q_1]$ .

Thus,

 $\mathbb{Q}/\mathbb{Z}$  is an infinite Abelian group.

**Problem 3.** Let p be a prime number and let  $Z(p^{\infty})$  be the following subset of the group  $\mathbb{Q}/\mathbb{Z}$ :

$$\mathbb{Z}(p^{\infty}) = \left\{ \left. \frac{a}{b} \in \mathbb{Q}/\mathbb{Z} \; \right| \; a,b \in \mathbb{Z}, \; b = p^i \; \text{for some} \; i \geq 0 \right\}.$$

Prove that  $\mathbb{Z}(p^{\infty})$  is an infinite subgroup of  $\mathbb{Q}/\mathbb{Z}$ .

*Proof.* Clearly,  $\mathbb{Z}(p^{\infty}) \subset \mathbb{Q}/\mathbb{Z}$ . Consider some integers  $i, j \geq 0$  and  $a_i, a_j \in \mathbb{Z}$ .

[Closure]: 
$$\left[\frac{a_i}{p^i}\right] + \left[\frac{a_j}{p^i}\right] = \left[\frac{p^j(a_i) + p^i(a_j)}{p^{i+j}}\right] \in \mathbb{Z}(p^{\infty}).$$

[Inverses]: 
$$[\frac{-a_i}{p^i}] + [\frac{a_i}{p^i}] = [0] \implies -[\frac{a_i}{p^i}] = [\frac{-a_i}{p^i}].$$

So  $\mathbb{Z}(p^{\infty}) \leq \mathbb{Q}/\mathbb{Z}$ . Now once more consider some integers  $i, j \in \mathbb{Z}^+$  but set a = 1. Notice that  $\frac{1}{p^i}, \frac{1}{p^j} \in (0, 1)$ . **Observe.** 

This result essentially follows from **Problem 2**.  $\left[\frac{1}{p^i}\right] = \left[\frac{1}{p^j}\right] \implies \left[\frac{1}{p^i}\right] - \left[\frac{1}{p^j}\right] = \mathbb{Z} \implies \frac{1}{p^i} - \frac{1}{p^j} \in \mathbb{Z}$ . Well,  $\frac{1}{p^i}, \frac{1}{p^j} \in (0,1) \implies \frac{1}{p^i} - \frac{1}{p^j} \in (-1,1) \implies \frac{1}{p^i} - \frac{1}{p^j} = 0 \implies \frac{1}{p^i} = \frac{1}{p^i} \implies i = j$ . On the other hand,  $i = j \implies \frac{1}{p^i} = \frac{1}{p^j} \implies \left[\frac{1}{p^j}\right] = \left[\frac{1}{p^j}\right]$  by definition. So then,

$$i = j \iff \left[\frac{1}{p^i}\right] = \left[\frac{1}{p^j}\right], \, \forall i, j \in \mathbb{Z}^+.$$

There are infinitely many distinct positive integers so there must be infinitely many distinct cosets in  $\mathbb{Z}(p^{\infty})$ . Thus,

 $\mathbb{Z}(p^{\infty})$  is an infinite subgroup of  $\mathbb{Q}/\mathbb{Z}$ .

**Problem 4.** If G is a finite group of even order, prove that G has an element of order two.

*Proof.* If G is a finite group of even order, then |G| = 2k and  $|G \setminus \{e\}| = 2k - 1$  for some  $k \in \mathbb{Z}^+$ . Suppose there doesn't exist an element of order 2 in G. Then,  $\forall g \in G \setminus e, g \neq g^{-1}$ . Observe.

If all non-identity elements are not equal to their inverse, then non-identity elements come two at a time. But then  $|G \setminus \{e\}| = 2k - 1$  is even, a contradiction.

Thus,

If G is a finite group of even order, then it contains an element of order 2.

**Problem 5.** Let  $Q_8$  be the multiplicative group generated by the complex matrices

$$A = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}, \qquad B = \begin{pmatrix} 0 & i \\ i & 0 \end{pmatrix}.$$

Observe that  $A^4 = B^4 = I_2$  and  $BA = AB^3$ . Prove that  $Q_8$  is a group of order 8.

*Proof.* Well,  $\Box$ 

**Problem 6.** Let G be a group and let Aut(G) denote the set of all automorphisms of G.

- (a) Prove that Aut(G) is a group with composition of functions as the binary operation.
- (b) Prove that  $\operatorname{Aut}(\mathbb{Z}) \cong \mathbb{Z}_2$ ,  $\operatorname{Aut}(\mathbb{Z}_6) \cong \mathbb{Z}_2$ ,  $\operatorname{Aut}(\mathbb{Z}_8) \cong \mathbb{Z}_2 \times \mathbb{Z}_2$ ,  $\operatorname{Aut}(\mathbb{Z}_p) \cong \mathbb{Z}_{p-1}$  (p prime).

**Problem 7.** Let G be an infinite group that is isomorphic to each of its proper subgroups. Prove that  $G \cong \mathbb{Z}$ .

**Problem 8.** Let G be the multiplicative group of  $2 \times 2$  invertible matrices with rational entries. Show that

$$A = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}, \qquad B = \begin{pmatrix} 0 & 1 \\ -1 & -1 \end{pmatrix}$$

have finite orders but AB has infinite order.

**Problem 9.** Let G be an abelian group containing elements a and b of orders m and n, respectively. Prove that G contains an element of order lcm(m,n).

**Problem 10.** Let H, K be subgroups of a group G. Prove that HK is a subgroup of G if and only if HK = KH.

Proof.

(⇒) 
$$HK \le G$$
 ⇒ For all  $hk \in HK$ ,  $(hk)^{-1} = k^{-1}h^{-1} \in HK$ . Therefore,  $HK = \{hk \mid h \in H, k \in K\} = \{k^{-1}h^{-1} \mid k \in K, h \in H\} = KH$ .

( $\Leftarrow$ ) Note  $HK = KH \implies \forall hk \in HK$ ,  $\exists (h_{k_1}, k_{h_1}) \in H \times K$ , such that  $hk = k_{h_1}h_{k_1} \in KH = HK$ . The same logic holds for 'flipped' elements  $kh \in KH = HK$ . Observe.

[Closure]: 
$$(h_1k_1)(h_2k_2) = (h_1k_1)(k_{h_2}h_{k_2}) = h_1(k_1k_{h_2})h_{k_2} = (k_1k_{h_2})h_1h_{k_1k_{h_2}}h_{k_2} \in KH = HK.$$

[Inverses]: For any 
$$hk \in HK$$
,  $(hk)^{-1} = k^{-1}h^{-1} \in KH = HK$ .

So  $HK \leq G$ .

Thus,

$$HK \leq G \iff HK = KH$$
.

**Problem 11.** Let H, K be subgroups of finite index of a group G such that [G:H] and [G:K] are relatively prime. Prove that G = HK.

*Proof.* We begin by proving  $(H \cap K) \leq H, K \leq G$ .

**[1-Step]:** 
$$\forall a,b \in (H \cap K) \implies ab^{-1} \in H \text{ and } ab^{-1} \in K \implies ab^{-1} \in (H \cap K) \implies (H \cap K) \leq H, K \leq G.$$

Since  $(H \cap K) \le H, K \le G$ , by the Tower Law for groups,

$$[G:(H\cap K)]=[G:H][H:H\cap K]=[G:K][K:H\cap K] \Longrightarrow [K:H\cap K]=\frac{[G:H][H:H\cap K]}{[G:K]}$$
 and  $\gcd([G:H],[G:K])=1\Longrightarrow [G:K]\mid [H:H\cap K].$ 

Now consider  $H_K = \{hK \mid h \in H\} \subseteq G/K$ .  $h_1K = h_2K \implies h_2^{-1}h_1 \in K \implies h_2^{-1}h_1 \in (H \cap K)$ . Well,  $h_1(H \cap K) = h_2(H \cap K) \implies h_2^{-1}h_1 \in (H \cap K)$ . So then we see that  $hK \in [h_1]_K \iff h(H \cap K) \in [h_1]_{(H \cap K)}$ ,  $\forall h \in H$ . Therefore,  $[h]_K \leftrightarrow [h]_{(H \cap K)}$  is clearly a bijection from  $H_K$  to  $H/(H \cap K)$ . Observe.

 $(H_K \subseteq G/K) \iff (|H_k| \le [G:K]) \text{ and then } (|H_k| \le [G:K]) \text{ with } ([G:K] \mid [H:H \cap K] = |H_K|) \implies |H_K| = [G:K] \text{ and so } H_k \not\subset G/K \implies H_K = \{hK \mid h \in H\} = G/K. \text{ Therefore, } \forall g \in G, \exists h_g \in H \text{ such that } gK = h_gK.$  Finally,  $h_g^{-1}g \in K \implies \exists k_g \in K \text{ such that } h_g^{-1}g = k_g \implies g = h_gk_g.$  So we see that  $\forall g \in G, \exists (h_g,k_g) \in H \times K \text{ such that } g = h_gk_g.$ 

Thus,

$$H, K \leq G$$
 and  $gcd([G:H], [G:K]) = 1 \implies G = HK$ .

**Problem 12.** Let H, K, N be subgroups of G such that  $H \subseteq N$ . Prove that  $HK \cap N = H(K \cap N)$ .

*Proof.* Notice that since  $H \subseteq N$ , HN = N. We show  $H(K \cap N) = HK \cap HN = HK \cap N$ .

 $[\subseteq]: \forall a \in H(K \cap N), a = hg \text{ where } h \in H \text{ and } g \in (K \cap N). \text{ Well, } g \in K \implies a = hg \in HK. \text{ Similarly,}$  $g \in N \implies a = hg \in HN. \text{ Therefore, } a \in HK \cap HN \implies H(K \cap N) \subseteq (HK \cap HN) = (HK \cap N).$ 

 $[\supseteq]: \forall a \in HK \cap HN, \ a = hg \text{ where } hg \in HK \text{ and } hg \in HN. \text{ So then } g \in K \text{ and } g \in N \text{ and we have } a = hg$  where  $h \in H$  and  $g \in K \cap N$ . Therefore,  $a \in H(K \cap N) \Longrightarrow H(K \cap N) \subseteq HK \cap HN = HK \cap N$ .

Thus,

$$H, K, N \leq G$$
 and  $H \subseteq N \implies HK \cap N = HK \cap HN = H(K \cap N)$ .

MATH 721 - Algebra II

**Problem 13.** Let H, K, N be subgroups of G such that  $H \subseteq K$ ,  $H \cap N = K \cap N$ , HN = KN. Prove that H = K.

*Proof.*  $H \subseteq K$  is given. We show  $K \subseteq H$  to prove the statement.

 $[\supseteq]: \forall k \in K, \exists h_k \in H \text{ such that } kN = h_kN \text{ and so } h_k^{-1}k \in N. \text{ Well, } h_k^{-1} \in H \subseteq K \text{ and so by closure } h_k^{-1}k \in M.$  $K \implies h_k^{-1}k \in (K \cap N) = (H \cap N). \text{ Finally, } h_k^{-1}k \in H \text{ and so } \exists h_* \in H \text{ such that } h_kk = h_* \implies k = h_kh_* \in H.$ Therefore,  $K \subseteq H$ .

Thus,

$$H, K, N \leq G$$
 and  $H \subseteq K, H \cap N = K \cap N, HN = KN \implies H = K$ .

**Problem 14.** Let H be a subgroup of G. For  $a \in G$ , prove that  $aHa^{-1}$  is a subgroup of G that is isomorphic to H.

**Problem 15.** Let G be a finite group and H a subgroup of G of order n. If H is the only subgroup of G of order n, prove that H is normal in G.

We prove the following lemma to be used for **Problem 16.** 

**Lemma.** Any subgroup H of a cyclic group G is cyclic, and if G has order  $N \in \mathbb{Z}^+$  there exists exactly one subgroup  $H_d \leq G$  of order d for each divisor d of |G| = N.

*Proof.* If  $H = \{e\}$  it is cyclic. If H is non-trivial, then it contains some  $h \neq e$ . Well, since  $h \in H \leq G$ ,  $h = g^k$  for some  $k \in \mathbb{Z}^+$ . So then there exists some minimal non-trivial power  $n = \min\{i \in \mathbb{Z}^+ \mid g^i \in H \setminus \{e\}\}$  of g present in  $H \setminus \{e\}$ . Observe.

By the division algorithm,  $\forall m \in \{i \in \mathbb{Z}^+ \mid g^m = H \setminus \{e\}\}\$ , there exist unique integers q, r with  $0 \le r < n$  such that

$$m = nq + r \implies g^m = g^{nq+r} = g^{nq}g^r \implies g^{m-nq} = g^r \in H.$$

But since n is the minimal power of g in H, r=0 otherwise we get a contradiction via 0 < r < n. So then for any  $m \in \mathbb{Z}^+$ , such that  $g^m \in H$ ,  $g^m = g^{nq_m} = (g^n)^{q_m}$  for some  $q_m \in \mathbb{N}$ . Therefore,  $H = \langle g^n \rangle$ , a cyclic group. Next, if G is finite and of order N, consider any divisor d of |G| = N. Since  $G = \langle g \rangle$ , |g| = N. Well, since d|N,  $\exists ! q \in \mathbb{Z}^+$  such that dq = N. So we see  $g^{dq} = g^N \implies (g^q)^d = e$ . Such a d is necessarily a minimal power that gives identity here since 0 < q, d and otherwise N = d'q < dq = N, which is nonsense. So  $|g^q| = d$ . So then there is only one power q of g that has order  $|g^q| = d$  (otherwise the existence of  $q' \neq q$  such that  $|g^{q'}| = d \implies N = q'd \neq qd = N$ ... nonsense.) Since any d-ordered subgroup  $H_d$  of G is cyclic, it must be generated by some power of G, of which there is only one and so  $H_d = \langle g^d \rangle$  is the only subgroup of order d|N.

Now we present the solution to 16 on the following page.

**Problem 16.** If H is a cyclic normal subgroup of a group G, then every subgroup of H is normal in G.

*Proof.* Suppose |H| = n. Since  $K \le H = \langle h \rangle$  where |h| = n, K is cyclic by our lemma and there exists some minimal positive power  $d \in \mathbb{Z}^+$  of h such that  $K = \langle h^d \rangle$ . So any  $k \in K$  is of the form  $k = (h^d)^q$  for some minimal power  $q \in \mathbb{Z}^+$ . Since  $H \le G$ ,

$$\forall g \in G, gHg^{-1} = H \iff \forall (g,h^q) \in G \times H, \exists h^p \in H, \text{ such that } gh^qg^{-1} = h^p. \text{ for any powers } p,q \in \mathbb{Z}^+$$

Observe.

$$(gh^{q}g^{-1})^{m} = \overbrace{(gh^{q}g^{-1})(gh^{q}g^{-1})\cdots(gh^{q}g^{-1})}^{m} = \overbrace{g(h^{2q}g^{-1})(gh^{q}g^{-1})\cdots(gh^{q}g^{-1})}^{m-1} = \cdots = gh^{mq}g^{-1} = h^{mp}.$$

So then for any  $k \in K = \langle h^d \rangle$ , where  $k = (h^d)^q = (h^q)^d$  and any  $g \in G$ ,  $\exists h^p \in H$  such that

$$gh^qg^{-1} = h^p \implies gkg^{-1} = g(h^q)^dg^{-1} = (g(h^q)g^{-1})^d = (h^p)^d = (h^d)^p \in \langle h^d \rangle = K.$$

Note that since  $gkg^{-1} = h^{dp}$  implies  $gk = h^{dp}g$ , there is only one power  $(h^d)^p \in K$  for which the equality holds otherwise we get a contradiction. So for each  $k_l \in K$ ,  $\exists ! k_r \in K$  such that  $gk_lg^{-1} = k_r$ . To avoid further nightmare indexing, note that we are taking the union of all conjugates  $gk_lg^{-1} \in gKg$  on the left side and showing that since each conjugate is paired with some unique  $k_r \in K$  on the right side. The union of all conjugates  $gk_lg^{-1}$  is equal to the union of all their unique partners  $k_r$  and since there are |K| conjugates and |K| unique partners, of course the right side must be all of K.

$$\bigcup_{k_l \in K} g k_l g^{-1} = g K g^{-1} = \bigcup_{g k_l g^{-1} = k_r \in K} k_r = K.$$

Thus,

$$K < H = \langle h \rangle \triangleleft G \implies K \triangleleft G.$$

**Problem 17.** What is  $Z(S_n)$  for  $n \ge 2$ ?

**Problem 18.** If H is a normal subgroup of G such that H and G/H are finitely generated, then G is finitely generated.

**Problem 19.** If N is a normal subgroup of G, [G:N] is finite, H is a subgroup of G, |H| is finite, and [G:N] and |H| are relatively prime, then H is a subgroup of N.

**Problem 20.** If N is a normal subgroup of G, |N| is finite, H is a subgroup of G, [G:H] is finite, and [G:H] and |N| are relatively prime, then N is a subgroup of H.

**Problem 21.** If G is a finite group and H, K are subgroups of G, then

$$[G:H\cap K]\leq [G:H][G:H].$$

**Problem 22.** If H, K, L are subgroups of a finite group G such that  $H \subseteq K$ , then

$$[K:H] \geq [L \cap K:L \cap H].$$

**Problem 23.** Let H, K be subgroups of a group G. Assume that  $H \cup K$  is a subgroup of G. Prove that either  $H \subseteq K$  or  $K \subseteq H$ .

Danny Banegas

*Proof.*  $H \cup K \leq G \implies \forall (h,k) \in H \times K$ , we have  $hk \in H \cup K$  by closure. Therefore,

 $H \cup K = \{g \mid g \in H \text{ or } g \in K\}$  so for each product  $hk \in H \cup K$  either  $hk = g \in H$  or  $hk = g \in K$  or both.

So in fact the only certainty here is that  $H \cup K \neq H \cup K$  otherwise  $hk \notin H \cup K$  which is a subgroup of G. Therefore, necessarily  $K \subset H$  or  $H \subset K$  or H = K.

Thus,

$$H, K, H \cup K \leq G \implies H \subseteq K \text{ or } K \subseteq H.$$

**Problem 24.** Let G be an abelian group, H a subgroup of G such that G/H is an infinite cyclic group. Prove that  $G \cong H \times G/H$ .
